

Governed intelligence. Longitudinal value.

VitaBahn is developing HADP as shared health and scientific intelligence infrastructure. Its initial commercial focus is longitudinal healthspan workflows: making fragmented data and evidence reviewable over time, with traceability and physician-controlled clinical decisions. [1,2]

Gamma

DEEPER SCIENCE & OMICS

Defined portfolio scope and roadmap; not a statement of clinical or market release. [2,3]

The need

Tests, functional assessments and visit records sit apart. HADP is designed to distinguish biological movement, risk and function without collapsing them into one wellness score. [1]

The first buyer

A longevity, preventive-health or precision-health clinic or medical centre with a defined follow-up problem, a clinical lead and a budget owner. Start with one workflow. [2]

The product distinction

A shared interpretation and governance layer, not an isolated test or autonomous diagnosis engine. Clinical pathways retain physician review and controlled release. [1,2]

The revenue model

Paid readiness and scoped evaluation, then qualified implementation and annual package licensing. Expansion can add workflows, users and sites. This is a model to validate, not booked revenue. [1,2]

Current position

A governed Alpha foundation and bounded engineering evidence exist. Clinical use, production and patient release remain separately gated. No clinical efficacy, regulatory clearance or verified customer revenue is claimed here. [1,3]

€3.0M

PROPOSED PRE-SEED

18-month execution programme [1]

Months 1–12: target full Beta build and acceptance.
Months 13–18: stabilisation, controlled activation and readiness.

Targets depend on funding, execution and required approvals.

Capital priorities: product and engineering; clinical/evidence operations; regulatory, legal, privacy and security work; commercial partnerships; corporate readiness and contingency. [1]

Investment fit → a defined diligence next step.
